The FPW-50 filter is designed for emergency drinking water supply for a group of 10 persons. The filter performs at 50 l/h and treatment of 20 liters of raw water occurs in about 25 minutes from the launch of the electric pump.

An electric pump is used for pumping water and it can be powered by included solar panels or from a car cigarette lighter socket or via the adapter directly from the battery. In the event of pump failure or lack of electrical power source, water pumping can be carried out using a hand pump located on the filter.

The case has got comfortable handles and wheels and it is made in the class IP67 with special equalization valve.
